## Load Libraries

```
pacman::p_load(cowplot, broom, dplyr, devtools, emmeans, ggbeeswarm, ggpmisc, ggplot2,
  knitr, lme4, lmerTest, readr, readxl, tidyr, tidyverse, install = FALSE)
```

## Load Data

```
aphid_count <- read_excel("data/fecundity_assay_count.xlsx") %>%
  filter(alate_alive_r1 != "control") %>%
  filter(block != 1) %>%
  mutate(nymphs_r1 = as.numeric(nymphs_r1), nymphs_r2 = as.numeric(nymphs_r2))
```

```
## Warning: There was 1 warning in `mutate()`.
## i In argument: `nymphs_r2 = as.numeric(nymphs_r2)`.
## Caused by warning:
## ! NAs introduced by coercion
```

```

# filter by block
aphid_count_block2 <- aphid_count %>%
  filter(block == 2)
aphid_count_block3 <- aphid_count %>%
  filter(block == 3)

# === Pivot to long format ===
aphid_long <- aphid_count %>%
  pivot_longer(cols = c(starts_with("nymphs_r"), starts_with("alate_alive_r")),
    names_to = c(".value", "round"), names_pattern = "(.*)_r(\\d)")

```

## Calculations

Calculating how many aphids are in each group as a new data frame

### survival

```

# === Survival summary by block and round ===
survival_summary <- aphid_long %>%
  group_by(treatment, block, round) %>% # Group data by treatment condition, experimental block, and round
  summarise(
    # Count how many alates were alive in each group (handling NAs just in case)
    alive_n = sum(alate_alive == "Yes", na.rm = TRUE),
    # Count how many alates were dead in each group
    dead_n = sum(alate_alive == "No", na.rm = TRUE),
    # Compute total number of alates observed (alive + dead)
    total = alive_n + dead_n,
    # Calculate percent survival per block per round (0-100%)
    survival_pct = 100 * alive_n / total,
    # Drop grouping structure after summarising (avoids nested data frames in later steps)
    .groups = "drop"
  )

# === Average survival across blocks ===
survival_summary_avg <- survival_summary %>%
  group_by(treatment, round) %>% # Now group just by treatment and round (collapsed across blocks)
  summarise(
    # Compute the mean survival percentage across all blocks in each treatment/round
    mean_survival = mean(survival_pct, na.rm = TRUE),
    # Calculate standard error: standard deviation divided by square root of the number of blocks
    se_survival = sd(survival_pct, na.rm = TRUE) / sqrt(n()),
    # Drop grouping again for a clean summary table
    .groups = "drop"
  )

```

### fecundity

```

# === block level ===
fecundity_by_block <- aphid_long %>%
  filter(!is.na(nymphs)) %>% # Remove missing nymph count entries

# Group by treatment, round, and block to calculate within-block variation
group_by(treatment, block, round) %>%
summarise(
  mean_fecundity = mean(nymphs, na.rm = TRUE), # Mean number of nymphs per alate in that
  se_fecundity   = sd(nymphs, na.rm = TRUE) / sqrt(n()), # Standard error of nymph counts in that
  n              = n(), # Number of alates (i.e., observations)
  .groups = "drop"
)

# === treatment level ===
fecundity_by_treatment <- aphid_long %>%
  filter(!is.na(nymphs)) %>% # Exclude missing nymph counts

# Step 1: Group by treatment, round, and block to compute block-level means
group_by(treatment, block, round) %>%
# Step 2: Group by treatment and round to compute treatment-level summaries
group_by(treatment, round) %>%
summarise(
  mean_fecundity = mean(nymphs, na.rm = TRUE), # Mean of block means
  se_fecundity   = sd(nymphs, na.rm = TRUE) / sqrt(n()), # Standard error across blocks
  n              = n(), # Number of alates (i.e., observations)
  .groups = "drop"
)

```

## Plot

### Plot aphid survival

```

# Filter by block

```

A bar chart titled 'Nymphs per Alate' on the y-axis and 'Treatment' on the x-axis. The y-axis scale goes from 0 to 50 in increments of 10. The x-axis has four categories: 220.1, MgCl2.1, 220.2, and MgCl2.2. The legend shows that olive green bars represent treatment '220' and brown bars represent treatment 'MgCl2'. Each bar has a black error bar centered at the top.

Treatment	220 (Nymphs per Alate)	MgCl2 (Nymphs per Alate)
220.1	~20.5	~15.5
MgCl2.1	~6.5	~9.5
220.2	~7.0	~9.0
MgCl2.2	~7.0	~9.0
